Energy & Environment

The Green Evolution

Clean Power Generation

- Environment protection is one of the basic pillars of the long term energy planning of the EU.
- Making the existing fossil-fuel plants more efficient won't be enough if we are to have any chance to prevent climate change.
- Renewable energy together with clean carbon technology have to be combined with a dramatic change in the way we consume energy.
- Science and technology is the easy part, as they provide the way.
- The economic and political aspects are the concerns of businesses and nations, but individuals are important as a source of pressure from below.

Tomorrow's Vision Services

Tomorrow's Vision provides expertise and facilitates the establishment and implementation of plans to ensure successful penetration of new clean technologies.

We provide advice about the way to raise the public and government awareness in respect of clean technologies and form the appropriate positive attitude among the decision makers towards innovative ways to balance energy demand with environment protection.

Our services are directed to

- Green technology businesses
- Environmental Institutions
- Groups of environmental sensitive individuals who aim to intervene and affect decision making
